## **Biomarker Discovery as a Pattern Mining Problem**

### Finding groups of disease-related molecular factors

- Single genetic variants, gene expression levels, protein abundancies are often not sufficiently indicative of disease outbreak, progression or therapy outcome.
- Searching for combinations of these molecular factors creates an enormous search space, and two inherent problems:
  - 1 Computational level: How to efficiently search this large space?
  - 2 Statistical level: How to properly account for testing an enormous number of hypotheses?
- The vast majority of current work in this direction (e.g. Achlioptas et al., KDD 2011) focuses on Problem 1, the computational efficiency.
- But Problem 2, multiple testing, is also of fundamental importance!

## Biomarker Discovery as a Pattern Mining Problem

Feature Selection: Find features that distinguish classes of objects

 Pattern Mining: Find higher-order combinations of binary features, so-called patterns, to distinguish one class from another

### Fisher's exact test

Contingency Table

	S = 1	S = 0	
$\mathbf{y} = 1$	а	$n_1 - a$	<i>n</i> <sub>1</sub>
<b>y</b> = 2	x - a	$n-n_1-x+a$	$n - n_1$
	X	n-x	n

- A popular choice is Fisher's exact test to test whether S is overrepresented in one of the two classes.
- The common way to compute *p*-values for Fisher's exact test is based on the hypergeometric distribution and assumes fixed total marginals (*x*, *n*<sub>1</sub>, *n*).

Multiple testing correction in pattern mining

• The number of candidate patterns grows exponentially with the cardinality of the pattern.

### Multiple testing correction in pattern mining

- The number of candidate patterns grows exponentially with the cardinality of the pattern.
- If we do not correct for multiple testing,  $\alpha$  per cent of all candidate patterns will be false positives.

### Multiple testing correction in pattern mining

- The number of candidate patterns grows exponentially with the cardinality of the pattern.
- If we do not correct for multiple testing,  $\alpha$  per cent of all candidate patterns will be false positives.
- If we do correct for multiple testing, e.g. via Bonferroni correction (<sup>α</sup>/<sub>#tests</sub>), then we lose any statistical power.

### Tarone's trick

■ Tarone's insight: When working with discrete test statistics (e.g. Fisher's exact test), there is a minimum *p*-value that a given pattern can obtain, based on its total frequency.

### Tarone's trick

- Tarone's insight: When working with discrete test statistics (e.g. Fisher's exact test), there is a minimum p-value that a given pattern can obtain, based on its total frequency.
- Tarone's trick (1990): Ignore those patterns in multiple testing correction, for which the minimum *p*-value is larger than the Bonferroni-corrected significance threshold.

### Tarone's trick

- Tarone's insight: When working with discrete test statistics (e.g. Fisher's exact test), there is a minimum *p*-value that a given pattern can obtain, based on its total frequency.
- Tarone's trick (1990): Ignore those patterns in multiple testing correction, for which the minimum *p*-value is larger than the Bonferroni-corrected significance threshold.
- If the *p*-values are conditioned on the total marginals (e.g. in Fisher's exact test), Tarone's trick does not increase the Family Wise Error rate.

### Tarone's approach (1990)

- For a discrete test statistics T(S) for a pattern S, such as in Fisher's exact test, there is a minimum obtainable p-value,  $p_{min}(S)$ .
- For some S,  $p_{min}(S) > \frac{\alpha}{m}$ . Tarone refers to them as untestable hypotheses  $\overline{U}$ .
- **Tarone's strategy**: Ignore untestable hypotheses  $\overline{U}$  when counting the number of tests *m* for Bonferroni correction.

### Tarone's approach (1990)

- For a discrete test statistics T(S) for a pattern S, such as in Fisher's exact test, there is a minimum obtainable p-value,  $p_{min}(S)$ .
- For some S,  $p_{min}(S) > \frac{\alpha}{m}$ . Tarone refers to them as untestable hypotheses  $\overline{U}$ .
- **Tarone's strategy**: Ignore untestable hypotheses  $\overline{U}$  when counting the number of tests *m* for Bonferroni correction.
- If the *p*-values of the test are conditioned on the total marginals (as in Fisher's exact test), this does not affect the Family-Wise Error Rate.

### Tarone's approach (1990)

- For a discrete test statistics T(S) for a pattern S, such as in Fisher's exact test, there is a minimum obtainable p-value,  $p_{min}(S)$ .
- For some S,  $p_{min}(S) > \frac{\alpha}{m}$ . Tarone refers to them as untestable hypotheses  $\overline{U}$ .
- **Tarone's strategy**: Ignore untestable hypotheses  $\overline{U}$  when counting the number of tests *m* for Bonferroni correction.
- If the *p*-values of the test are conditioned on the total marginals (as in Fisher's exact test), this does not affect the Family-Wise Error Rate.
- Difficulty: There is an interdependence between m and  $\overline{U}$ .

Seminar Basel | April 21, 2016 | 8 / 41

### Tarone's approach (1990)

- Assume *k* is the number of tests that we correct for.
- m(k) is the number of testable hypotheses at significance level  $\frac{\alpha}{k}$ .
- Then the optimization problem is

 $\min k \\ \text{s. t. } k \ge m(k)$ 

Department Biosystems Karsten Borgwardt

Seminar Basel | April 21, 2016 | 9 / 41

### Tarone's approach (1990)

• Assume k is the number of tests that we correct for.

m(k) is the number of testable hypotheses at significance level <sup>α</sup>/<sub>k</sub>.
 procedure TARONE
 k := 1;
 while k < m(k) do</li>
 k := k + 1;

return k

Department Biosystems Karsten Borgwardt

Terada's link to frequent itemset mining (Terada et al., PNAS 2013)

- For  $0 \le x \le n_1$ , the minimum p-value  $p_{min}(S)$  decreases monotonically with x.
- One can use *frequent itemset mining* to find all S that are testable at level α, with frequency ψ<sup>-1</sup>(α).
- They propose to use a decremental search strategy:

```
procedure TERADA'S DECREMENTAL SEARCH (LAMP)

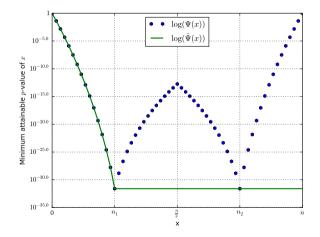

k := "very large";

while k > m(k) do

k := k - 1;

m(k) := frequent itemset mining(D, \psi^{-1}(\frac{\alpha}{k}));

return k + 1
```

### Example: PTC dataset (Helma et al., 2001)

#### **ETH** zürich

# Significant Subgraph Mining (Sugyiama et al., SDM 2015)

### Significant Subgraph Mining

- Each object is a graph.
- A pattern is a subgraph in these graphs.
- Typical application in Drug Development: Find subgraphs that discriminate between molecules with and without drug effect.
- Counting all tests (= all patterns) requires exponential runtime in the number of nodes.

Department Biosystems Karste

Karsten Borgwardt

Seminar Basel | April 21, 2016 | 14 / 41

## Significant Subgraph Mining (Sugyiama et al., SDM 2015)

Incremental search with early stopping

procedure Incremental search with early stopping

 $\theta := 0$ 

repeat

 $\theta := \theta + 1$ ;  $FS_{\theta} := 0$ ;

repeat

find next frequent subgraph at frequency  $\theta$   $FS_{\theta} := FS_{\theta} + 1$  **until** (no more frequent subgraph found) or  $(FS_{\theta} > \frac{\alpha}{\psi(\theta)})$  **until**  $FS_{\theta} \leq \frac{\alpha}{\psi(\theta)}$ **return**  $\psi(\theta)$ 

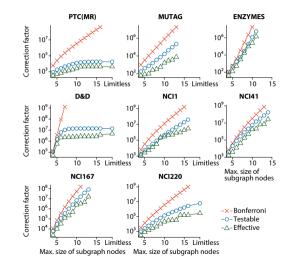

•  $\frac{\alpha}{\psi(\theta)}$  is the maximum correction factor, such that subgraphs with frequency  $\theta$  can be significant at level  $\psi(\theta)$ .

## Significant Subgraph Mining on PTC Dataset

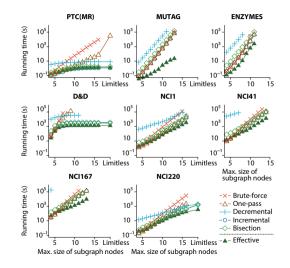

Dataset from Helma et al. (2001)

### Westfall-Young light (Llinares-Lopez et al., KDD 2015)

### Dependence between hypotheses

- As patterns are often in sub-/superpattern-relationships, they do not constitute independent hypotheses.
- Informally: The underlying number of hypotheses may be much lower than the raw count.
- Westfall-Young-Permutation tests (Westfall and Young, 1993), in which the class labels are repeatedly permuted to approximate the null distribution, are one strategy to take this dependence into account.
- Computational problem: How to efficiently perform these thousands of permutations?
- There is one existing approach, FastWY (Terada et al., ICBB 2013), which suffers from either memory or runtime problems.

### Westfall-Young light (Llinares-Lopez et al., KDD 2015)

### The Algorithm

**1** Input: Transactions D, class labels y, target FWER  $\alpha$ , number of permutations  $j_p$ .

**2** Perform  $j_p$  permutations of the class label **y** and store each permutation as  $\mathbf{c}_j$ .

3 Initialize 
$$heta:=1$$
 and  $\delta^*:=\psi( heta)$  and  $p_{min}^{(j)}:=1.$ 

4 Perform a depth first search on the patterns:

- Compute the *p*-value of pattern S across all permutations, update  $p_{min}^{(j)}$  if necessary.
- Update  $\delta^*$  by  $\alpha$ -quantile of  $p_{min}^{(j)}$ , and increase  $\theta$  accordingly.
- Process all children of S with frequency  $\geq \psi^{-1}(\delta^*)$ .
- **5 Output**: Corrected significance threshold  $\delta^*$ .

### Westfall-Young light (Llinares-Lopez et al., KDD 2015)

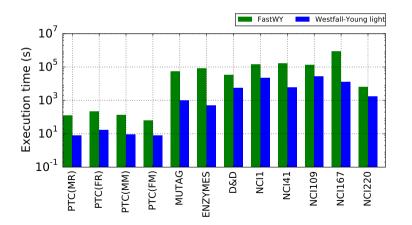

### Speed-up tricks of Westfall-Young light

- Follows incremental search strategy rather than decremental search strategy of FastWY
- Performs only one iteration of frequent pattern mining
- Does not store the occurrence list of patterns
- Does not compute the upper  $1 \alpha$  quantile of minimum p-values exactly.
- Reduces the number of cell counts that have to be evaluated
- Shares the computation of p-values across permutations

Better control of the Family-wise error rate (Enzymes)

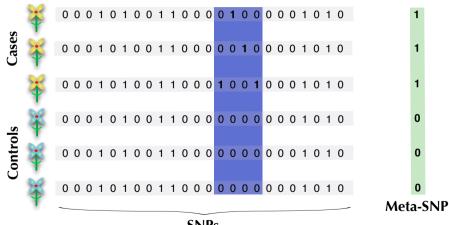

### Genetic heterogeneity

- Genetic heterogeneity refers to the phenomenon that several different genes or sequence variants may give rise to the same phenotype.
- The correlation between each individual gene or variant and the phenotype may be too weak to be detected, but the group may have have a strong correlation.
- The only current way to consider genetic heterogeneity is to consider fixed groups of variants. Genome-wide scans cause tremendous computational and statistical problems.

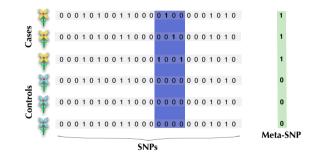

### Fast Automatic Interval Search (Llinares-Lopez et al., ISMB 2015)

- Our goal is to search for intervals that may exhibit genetic heterogeneity, while
  - allowing for arbitrary start and end points of the intervals,
  - properly correcting for the inherent multiple testing problem, and
  - retaining statistical power and computational efficiency.
- We model the search as a pattern mining problem: Given an interval, an individual contains a pattern, if it has at least one minor allele in this interval.

Department Biosystems Karsten Borgwardt

Seminar Basel | April 21, 2016 | 29 / 41

Finding trait-associated genome segments with at least one minor allele

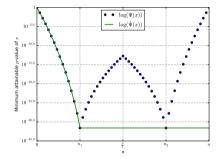

An interval is represented by its maximum value. The longer an interval, the more likely it is that this maximum is 1.

Department Biosystems Kars

Karsten Borgwardt

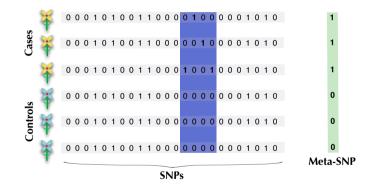

Seminar Basel | April 21, 2016 | 30 / 41

 Pruning criterion 1: If too many individuals have a particular pattern, the corresponding interval is not testable.

Department Biosystems Karsten Borgwardt

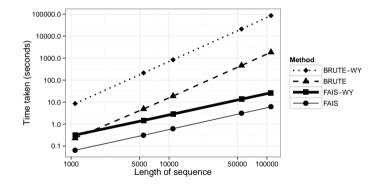

Seminar Basel | April 21, 2016 | 31 / 41

Pruning criterion 2: If a pattern is too frequent to be testable, then none of the superintervals of the corresponding interval is testable.

Department Biosystems Karsten Borgwardt

Seminar Basel | April 21, 2016 | 32 / 41

 Our method FAIS (Fast Automatic Interval Search) improves over the brute-force interval search in terms of runtime in simulations.

Karsten Borgwardt

Seminar Basel | April 21, 2016 | 35 / 41

# FAIS: Conclusions and Outlook

#### Conclusions

- We can search for intervals that may exhibit genetic heterogeneity
  - efficiently,
  - without pre-defining the boundaries of intervals,
  - while properly correcting for multiple testing.

# FAIS: Conclusions and Outlook

#### Conclusions

- We can search for intervals that may exhibit genetic heterogeneity
  - efficiently,
  - without pre-defining the boundaries of intervals,
  - while properly correcting for multiple testing.

#### Outlook

Genetic heterogeneity discovery: How to extend our approach to human genetics?

Department Biosystems Karsten Borgwardt

Seminar Basel | April 21, 2016 | 36 / 41

# FAIS: Conclusions and Outlook

#### Conclusions

- We can search for intervals that may exhibit genetic heterogeneity
  - efficiently,
  - without pre-defining the boundaries of intervals,
  - while properly correcting for multiple testing.

#### Outlook

- Genetic heterogeneity discovery: How to extend our approach to human genetics?
- In General: Machine Learning and Data Mining will gain further importance in Systems Biology and Personalized Medicine.

# Significant Pattern Mining: Summary & Outlook

#### Summary

- We have shown how to enable significant pattern mining
  - in subgraph mining,
  - in association rule mining while taking dependence into account,
  - in interval-based genome-wide association mapping.

### Outlook

- Pattern summarization
- Conditioning on covariates (Llinares-Lopez et al., arxiv 2015)
- Network-based genome-wide association mapping
